SMART AND INTUITIVE OSSEOINTEGRATED TRANSFERMORAL PROSTHESIS EMBODYING ADVANCED DYNAMIC BEHAVIORS

Osseointegrated Implant

Implantable Myoelectric Sensors on Targeted Reinnervated Muscles

Variable Stiffness Actuators & Novel Composite Materials

www.myleg.eu
MyLeg will develop a new generation of powered transfemoral prosthetic legs that can be intuitively operated, sensed, and trusted as the healthy and reliable counterpart for a variety of tasks.

PROJECT OBJECTIVES:
• To enhance human-prosthesis interaction, perception, and motion capabilities by exploiting osseointegration.
• To provide an intuitive control and to extend the user’s cognitive capabilities by using implantable myoelectric sensors on targeted reinnervated muscles.
• To achieve energy efficiency, dependability, and adaptability to different tasks by designing novel variable stiffness actuators and composite materials.

EXPECTED IMPACT:
• MyLeg will have a societal impact. Transfemoral amputees will better accept the prosthesis, their quality of life will improve, they will reach a higher degree of self-reliance, their social contacts will be enlarged, their (re-)integration in the society and in the labour-market will be facilitated.
• MyLeg will have an economic impact. Transfemoral amputees will need less support by formal/informal caregivers, which will reduce the burden on these groups and on society as a whole.
• MyLeg will impact the leadership role of Europe in the prosthetic market and, more in general, in the robotic world.
